Priority number(s): DE20001015103 20000328; DE19991015805 19990408

Abstract of DE10015103

By inputting a password, files or programs stored on a data carrier are released to allow access by an authorized person. A printing machine computer (2) contains a reading device (3) for files or programs. The computer stores a digital machine variant key (S), containing specific requirements of the hardware and software components of the machine, and identification numbers (C1, C2, Cn) of the files or programs needed to operate the machine. After input of the password for a file or program, the password, the identification numbers, and the machine key is subjected to a mathematical procedure which creates a bit pattern in a store.
